

HTTP Referrers Mod

2005-11-15 16:50:25 by hireamerica

Updated HTTP Referrers code will do the following:

- `http://` will be added if not present (for consistency!)
- `www.` will be added to base urls if not present (for consistency!)
- `http://www.site.com/name?=text` will become `http://www.site.com`
- Each additional referral will bump up the count
- Each additional referral will bump up the last date

Essentially your `index.php` file will have the referer code removed to an includes file to handle referrals.

You will have a cleaner, better base of referral information!

Download from [HireAmerica](#) (sorry but downloads require simple registration) and enjoy!

PS - This might get included in NukeSentinel (e.g., Tracked Referrers) in the future!
