

TegoNuke(tm) ShortLinks 1.1.0 Released

2007-07-03 13:06:07 by montego

A few new features have been built into ShortLinks with this new version as well as a couple of small bug fixes. A new "Auto Tap Link" feature was added that when turned on, it will take another pass at the site HTML and find all the untapped modules.php links. It will then attempt to find a corresponding GT-module name.php script to shorten the links with. If it does not find a ShortLinks file, it will suggest to the admin at the bottom of the page that he/she might want to create a GT file for the given module (will only show to the admin and only when debug is turned on)

This new release is available in the [Downloads](#) now. Here is what has changed in this release:

Bug Reports:

- TNSL_0000084 Entities within a URL messes up the "Tap"
- TNSL_0000124 Footer debug messages show up at the top of the page

Enhancements:

- TNSL_0000039 Added admin ability to show additional links needing "tap" when in debug mode
- TNSL_0000109 Added Advertising module to the core
- TNSL_0000110 Created overall "Recursive Tap" code for the entire page.

Visit Montego Scripts [Project Page](#) for more detailed information about this add-on/hack. You may also get it directly from the [Download Page](#).
