

Firefox rushes out fix for password manager bug

2008-09-29 23:59:26 by Raven

Just days after shipping a patch for [a dozen serious security holes in Firefox](#), Mozilla has rushed out another version to fix an annoying password manager bug.

The newest [Firefox 3.0.3](#) basically fixes a problem where users were unable to retrieve saved passwords or save new passwords.

Firefox's Mike Beltzner explains:

* The symptom is that users who have password data stores with non-ASCII data saved as something other than UTF-8 (more common for people who have saved passwords on IDN domains or non en-US domains) will not be able to access their saved passwords or create any new saved passwords. There is no permanent data loss, the saved data is just inaccessible.

Also see [Bug 454708](#).
