

GamerCards Module Released

2010-05-19 19:46:22 by snype

This module is very basic but yet very good, It was made because there is nothing for phpnuke that allows one's users to generate there own type of gamercard and that's where this module (GamerCards) comes into it, This module will let you generate a gamercard for the following applications:

- * XBOXLIVE
- * STEAM
- * XFIRE

It will then output the result in image form to show you what the card will look like before you go ahead and use it.

It generates the [html] and [bbcode] for use on and throughout your site and others. It has a menu separating each of the three cards so your users get to choose what card they want by clicking the relevant menu. It is very user friendly and 100% XHTML compliant it has no admin side to it and no SQL tables need installing.

You can purchase this from clanthemes @ [Here](#) and as a thanks to the nuke community every sale that it has will go towards sites that have helped the community be what it is today.
