

## Inferno™ Released

2004-12-25 20:57:13 by Techgfx

Hiyas all,

I have released Inferno™ to the public. Inferno™ allows you to run PHP-Nuke Platinum 7.6.0 from home via usage of a local server.

**Download Inferno™** [Available here](#)

Inferno™ uses the revolutionary and widely accepted InstallSheild to setup relevant server files onto your computer. The installation process takes approximately 30seconds, however this slightly varies depending on your computer specifications. After the installation is complete no reset is required and you can immidiately start using PHP-Nuke Platinum v.7.6.0 off your own computer.

Inferno™ will run in real-time is correlation with your computer / local server. Expected page generations can vary from 0.01 - 0.03 seconds.

Inferno™ automatically opens your default web browser and directs you to the home of your new local server. At any point in time you can access your local server by entering <http://localhost> into your web browser.

Inferno™ uses the most stable latest releases of Apache, PHP, MySQL and PHPMyAdmin. These components essentially enable Inferno™ to run.

Apache:

- v.1.3.33

MySQL:

- v.4.1.18

PHP:

- v.4.3.10

PHPMyAdmin:

- v.2.6.0 PL-3

Zend Optimizer:

- v.2.5.7

I look forward to seeing you all in the new year, and enjoy the first official release of Inferno™, with many more to come and a new Inferno™ community coming very soon.
